

# CockroachDB Einführung, Aufbau und Anwendung von NewSQL

Marvin Bermel, PSE, Böblingen, 21-11-2020 - Modul 3 / Datenbanken -

# Agenda

- Wie wurden Datenbanken entwickelt?
  - Historischer Überblick
- Wer ist CockroachDB?
  - Idee und externe Komponenten
- Was ist CockroachDB?
  - Aufbau und Eigenschaften
- Was bietet CockroachDB noch?
  - Sonstige Eigenschaften
- Anhang

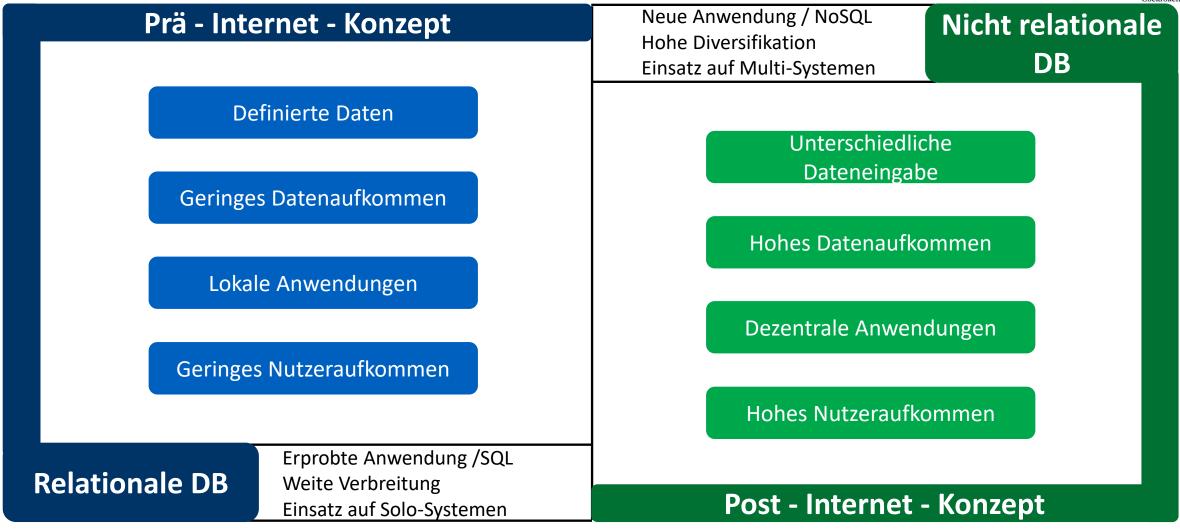

Welche Probleme adressieren moderne Datenbanken?
- Historie und Motivation -

Mercedes-Benz

### - Historie -

### Datenmodellierung

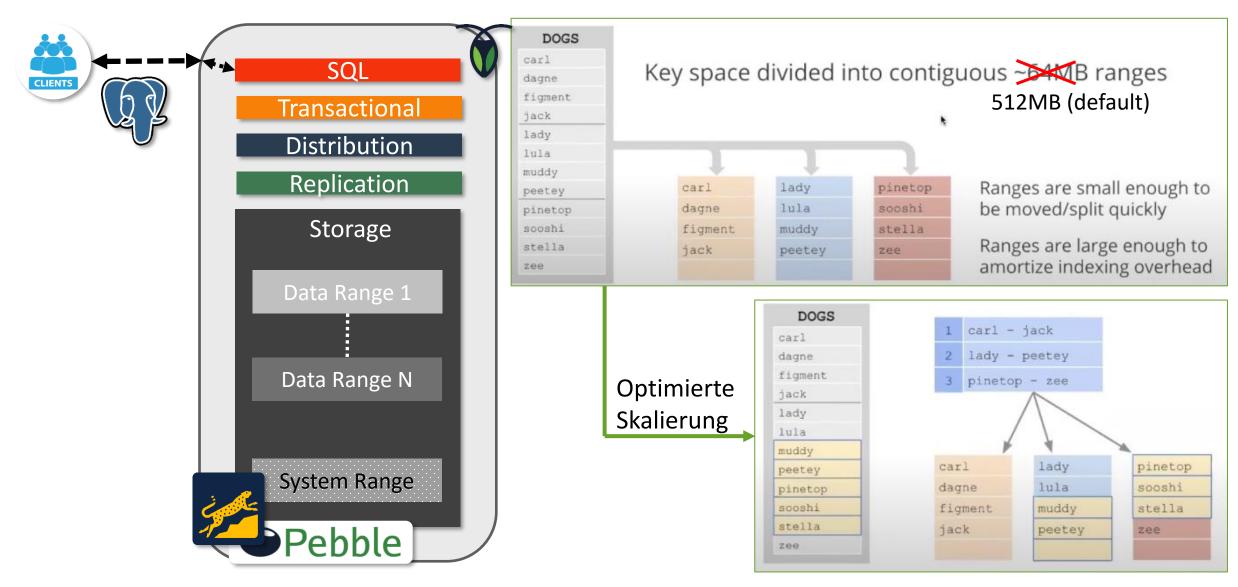

#### Relational

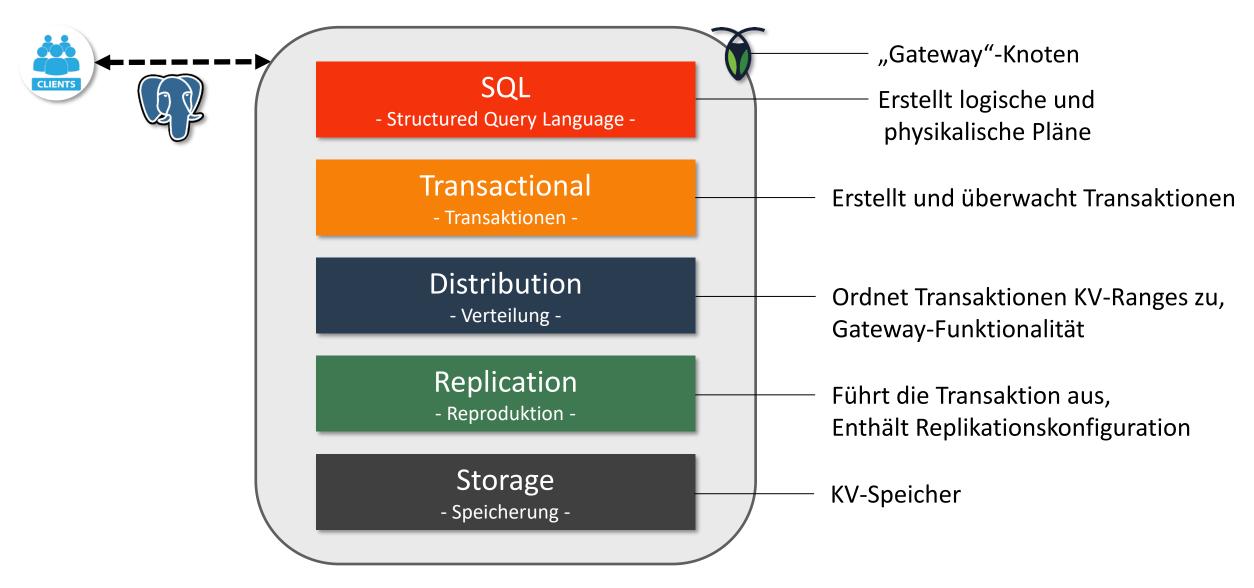

ID	Name	Price	
1	Bat	1.11	
2	Ball	2.22	
3	Glove	3.33	
4	Bat	4.44	

Key	Value
/inventory/name_idx/"Bat"/1	Ø
/inventory/name_idx/"Ball"/2	Ø
/inventory/name_idx/"Glove"/3	Ø
/inventory/name_idx/"Bat"/4	Ø

Cockroachos

CockroachDB

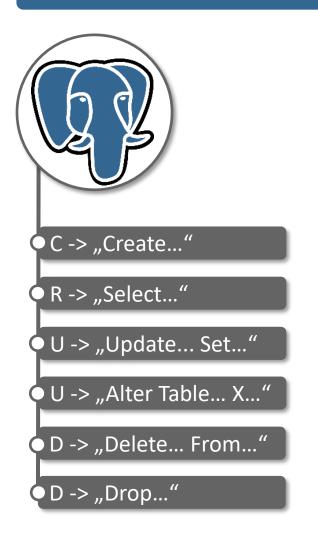

Was bietet CockroachDB noch?

- CRUD, Skalierbarkeit, Tools-

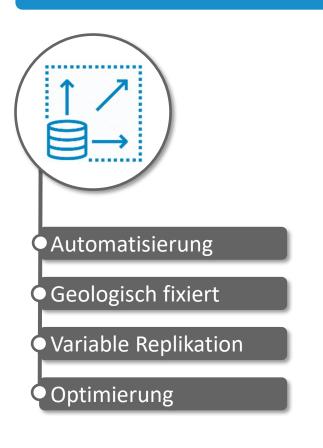

# - Eigenschaften -

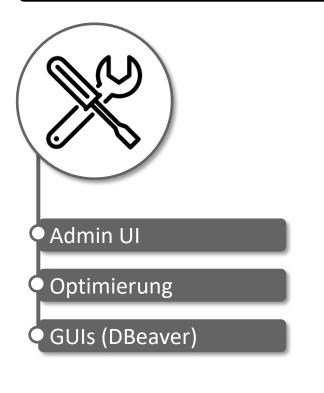

### **CRUD**

### **Skalierbarkeit**

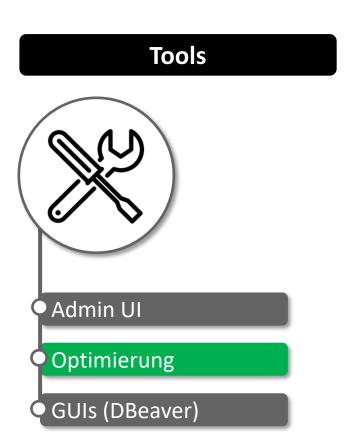

### **Tools**

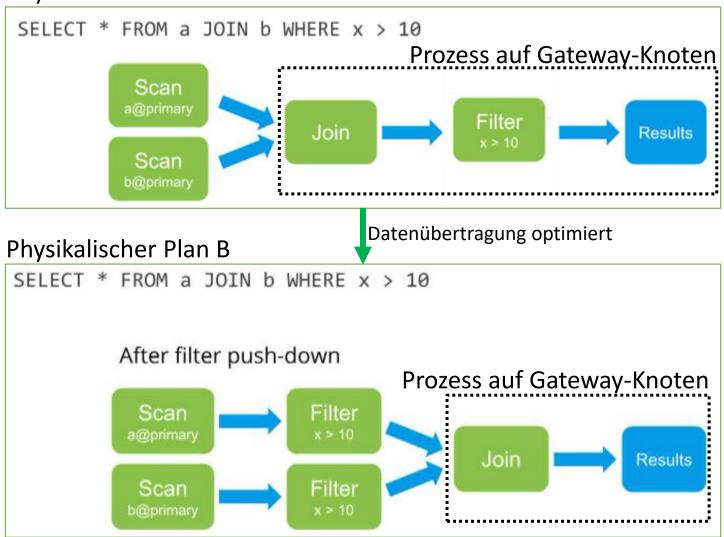

## - Optimierte DistSQL -

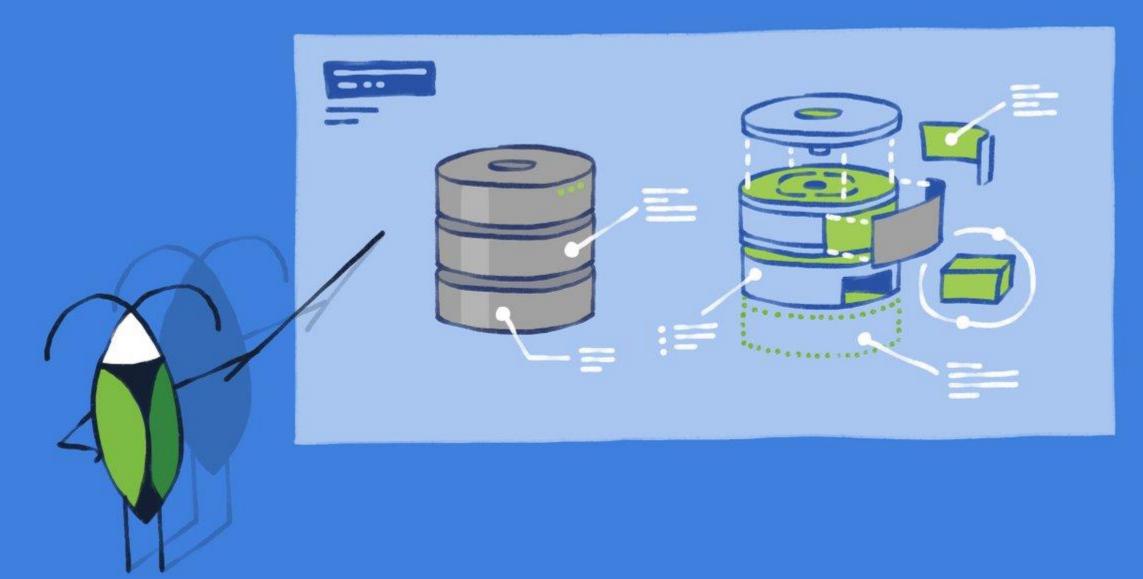

### Physikalischer Plan A

# – Danke für Ihre und eure Aufmerksamkeit –

# - Sonstiges -

- Vergleich Datenbanken -

24

	RELATIONAL Single instance, transactions on legacy infrastructure	NOSQL Global, optimized for read access to data	DISTRIBUTEDSQL Architected for transactiona cloud applications
Scale	Difficult manual shard or asynchronous replication	Automated for read only access of data	<ul> <li>Simple, global scale for reads and writes</li> </ul>
Resilience	Active passive failover creates RPO lag	<ul> <li>Distributed data allows for quick global reads</li> </ul>	All active redundancy eliminates RPO
Transactions	Ensures consistent transactions	<ul> <li>Limited transactional capability</li> </ul>	<ul> <li>Serializable isolation ensures consistency</li> </ul>
Cloud	Architected for legacy infrastructure	<ul> <li>Architected for web, read only infrastructure</li> </ul>	<ul> <li>Architected for cloud-native apps</li> </ul>

# Beispiel logischer Plan

. DistSQL -

### **SQL** Input

```
TABLE Orders (OId INT PRIMARY KEY, CId INT, Value DECIMAL, Date DATE)

SELECT CID, SUM(VALUE) FROM Orders

WHERE DATE > 2015

GROUP BY CID

ORDER BY 1 - SUM(Value)
```

### Logischer Plan Stufe 2 (mit "ORDER BY")

```
src -> summer -> sortval -> sort(OrderSum) -> final
```

### Logischer Plan Stufe 1 (ohne "ORDER BY")

```
TABLE-READER src
 Table: Orders
 Table schema: Oid:INT, Cid:INT, Value:DECIMAL, Date:DATE
 Output filter: (Date > 2015)
 Output schema: Cid:INT, Value:DECIMAL
 Ordering guarantee: Oid
AGGREGATOR summer
 Input schema: Cid:INT, Value:DECIMAL
 Output schema: Cid:INT, ValueSum:DECIMAL
 Group Key: Cid
 Ordering characterization: if input ordered by Cid, output ordered by Cid
EVALUATOR sortval
 Input schema: Cid:INT, ValueSum:DECIMAL
 Output schema: SortVal:DECIMAL, Cid:INT, ValueSum:DECIMAL
 Ordering characterization:
   ValueSum -> ValueSum and -SortVal
   Cid, ValueSum -> Cid, ValueSum and Cid, -SortVal
   ValueSum, Cid -> ValueSum, Cid and -SortVal, Cid
 SQL Expressions: E(x:INT) INT = (1 - x)
 Code {
    EMIT E(ValueSum), CId, ValueSum
AGGREGATOR final:
 Input schema: SortVal:DECIMAL, Cid:INT, ValueSum:DECIMAL
 Input ordering requirement: SortVal
 Group Key: []
Composition: src -> summer -> sortval -> final
```

# Beispiel physikalischer Plan

. DistSQL -

Logischer Plan

Umsetzung unter Berücksichtig der internen Einschränkungen

- Leaseholder
- Latenz
- Geo-Location
- Auslastung etc.

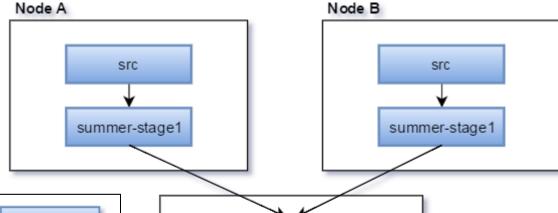

summer

sortval

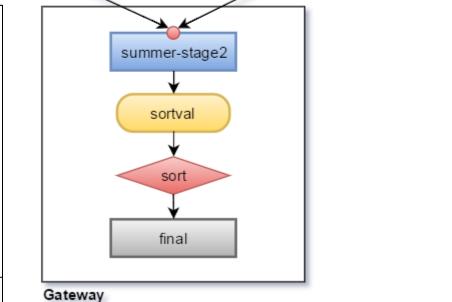

sort

final

#### TABLE-READER src Table: Orders Table schema: Oid:INT, Cid:INT, Value:DECIMAL, Date:DATE Output filter: (Date > 2015) Output schema: Cid:INT, Value:DECIMAL Ordering guarantee: Oid AGGREGATOR summer Input schema: Cid:INT, Value:DECIMAL Output schema: Cid:INT, ValueSum:DECIMAL Group Key: Cid Ordering characterization: if input ordered by Cid, output ordered by Cid EVALUATOR sortval Input schema: Cid:INT, ValueSum:DECIMAL Output schema: SortVal:DECIMAL, Cid:INT, ValueSum:DECIMAL Ordering characterization: if input ordered by [Cid,]ValueSum[,Cid], output ordered by [Cid,]-ValueSum[,Cid] SQL Expressions: E(x:INT) INT = (1 - x)

Physikalischer Plan

EMIT E(ValueSum), CId, ValueSum

Code {
